Elite Amplify: Engineering Spec (v1.0)

Oct 13, 2026 · @Mainak Sarkar · Companion to *PRD: Elite Tokens and Social Ladder (v2.0)*

1. Overview

Amplify lets any diner spend Elite Tokens to show any published experience, their own or someone else's, to more diners, as a labelled card in the feed, for a fixed number of days up to a target number of qualified impressions. This spec defines everything engineering needs to build it: eligibility, lifecycle, Token handling, delivery logic, impression counting, data, APIs and acceptance criteria.

Scope (MVP)

- Three tiers: Quick, Momentum, Spotlight. Open to every diner; no level gate.
- Feed delivery only (home/discovery feed). No search, map or restaurant-page placement.
- No diner-chosen targeting. Audience is decided by the system (Section 6).
- Diners pay in Tokens. Restaurants buy monthly memberships in rupees that auto-Amplify their latest positive experiences (Section 11).

Out of scope: targeting controls, scheduling more than 7 days ahead, Amplifying curations or profiles, ads.

Decisions this spec makes (confirm before build)

#	Decision	Rule in this spec
D1	What counts as a qualified impression	50%+ of the card visible for 1+ continuous second, once per viewer per Amplify (Section 2)
D2	Who sees an Amplified card	Diners in the restaurant's city, highest relevance first (Section 6)
D3	How often Amplified cards appear	Max 1 per 8 organic cards, 3 per session, 6 per viewer per day
D4	Refunds	None. If delivery is below 90% of target when the window ends, the window auto-extends until it reaches 90% (Section 5)
D5	Stopping an active Amplify	The sponsor can stop their own; the author can stop any Amplify on their experience. No refund either way

#	Decision	Rule in this spec
D6	*Not Worth It* experiences	Can be Amplified immediately after posting, for any restaurant including Elite Partners
D7	Creator grant Tokens on Amplify	No cap (config flag, pending product decision)
D14	Who can Amplify	Any diner can Amplify any eligible experience, their own or anyone else's

2. Definitions

- **Amplify (amplification):** one purchase that boosts one experience on one tier. Identified by `amplification_id`.
- **Sponsor:** the diner who paid for the Amplify. Can be the experience's author or anyone else.
- **Author:** the diner who wrote the experience.
- **Amplified card:** the experience card served from the Amplify pool, showing an *Amplified* label with sponsor attribution (label copy is an open decision).
- **Render:** the client drew the Amplified card in the feed.
- **Qualified impression:** a render where all of these hold:
  - at least 50% of the card's area was on screen for at least 1,000 ms continuously;
  - the viewer is logged in, is neither the author nor the sponsor, has no block with either, and is not flagged as bot, farm or ON_HOLD;
  - the Amplify was ACTIVE at the time of the render;
  - it's the first qualified impression for this viewer on this Amplify (dedupe key: `amplification_id + viewer_id`).
- **Target:** the qualified impressions the tier promises (250 / 750 / 2,000).
- **Delivered:** count of qualified impressions; delivery stops at target.
- **Delivery window:** start_at to end_at. end_at moves out for system pauses and for under-delivery extensions.
- **Queue:** an experience has at most one live Amplify. A new Amplify on an experience that already has one waits in SCHEDULED and starts when the live one ends.
- **Organic impression:** the same experience seen through normal feed ranking. Never counted toward the target, and an Amplified card is never served to a viewer who already had an organic impression of that experience in the last 7 days.

3. Tiers and eligibility

Tiers (config, editable without release)

tier_id	Tokens	Duration	Target (qualified impressions)	Daily delivery cap
quick	150	3 days	250	125
momentum	350	7 days	750	161
spotlight	700	14 days	2,000	215

Daily delivery cap = ceil(target ÷ duration × 1.5). It stops one day eating the whole target and keeps delivery spread across the window.

Eligibility check

The eligibility endpoint runs these checks in order and returns every failing reason code, not just the first.

Check	Rule	Reason code
Published	Experience is published and public	NOT_PUBLIC
Moderation	Not rejected, disputed or reported-pending. If moderation is still pending, purchase is allowed and the Amplify waits in SCHEDULED until it passes	NOT_MODERATED
Complete	Meets full-experience rules (restaurant + outlet, sentiment, title 10+, body 120+)	INCOMPLETE
Originality	Passed originality check	NOT_ORIGINAL
Age	Published within the last 90 days	TOO_OLD
Author permission	If the sponsor isn't the author: the author hasn't turned off *Let others Amplify my experiences*, globally or for this experience	AUTHOR_DISABLED
Queue depth	Fewer than 3 Amplifies already queued on this experience	QUEUE_FULL

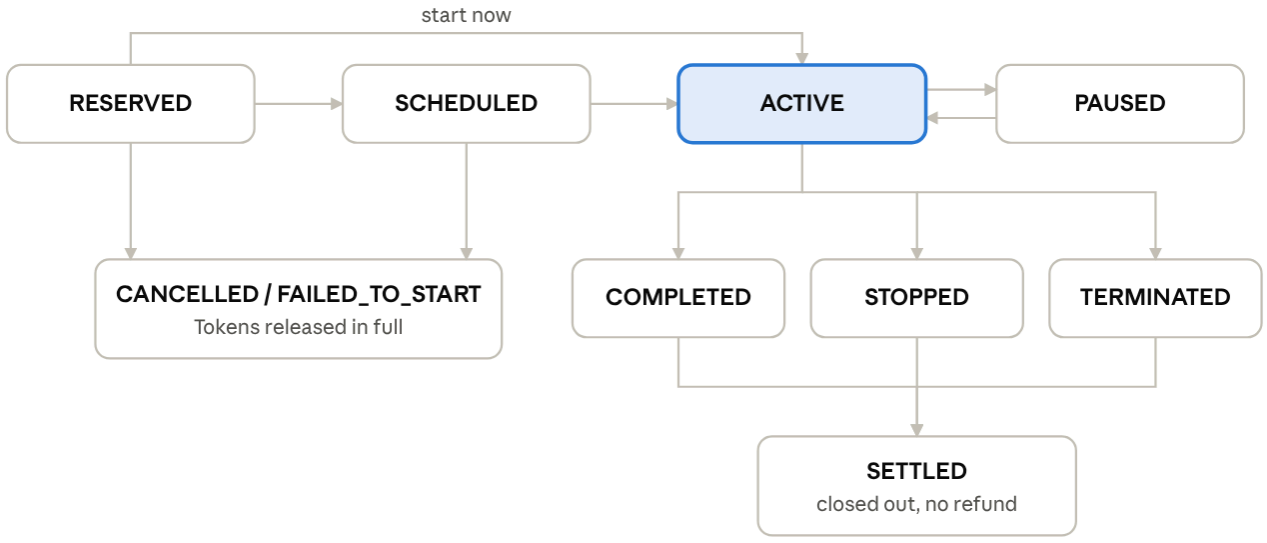

Check	Rule	Reason code
Sponsor concurrency	Sponsor has fewer than 2 ACTIVE, PAUSED or SCHEDULED Amplifies	SPONSOR_LIMIT
Account	Sponsor not ON_HOLD	ACCOUNT_HOLD
Balance	Sponsor's spendable balance ⩾ tier price and balance not negative	INSUFFICIENT_TOKENS
Inventory	City capacity available for the requested start (Section 6)	NO_CAPACITY (with earliest_start)

Sentiment doesn't matter: *Not Worth It* experiences, including those about Elite Partners, can be Amplified right after posting, by the author or anyone else. Wallet activation is not required if the sponsor has enough spendable Tokens (starter allowance excluded: it's AI and Elara only; Creator grant Tokens are allowed).

4. Lifecycle

An Amplify moves through ten states. Tokens are held at RESERVED and spent at ACTIVE. Once spent they are final: there are no refunds, and under-delivery is fixed by extending the window, not by returning Tokens.

Tokens are spent when an Amplify goes active and are never refunded

Amplify lifecycle · 10 states

From	To	Trigger	Token effect
(none)	RESERVED	Sponsor confirms purchase	Reserve tier price (redemption RESERVED)
RESERVED	ACTIVE	Start now, moderation passed, no live Amplify on the experience	Commit: reserved → SPENT
RESERVED	SCHEDULED	Future start_at (max 7 days), moderation still pending, or another Amplify is live on the experience (queued)	Stays reserved
SCHEDULED	ACTIVE	start_at reached, moderation passed, previous Amplify on the experience ended, and eligibility re-check passes	Commit
RESERVED / SCHEDULED	CANCELLED	Sponsor cancels before start	Release (nothing was spent)
RESERVED / SCHEDULED	FAILED_TO_START	Re-check fails at start (experience rejected, removed, deleted or made private), or a "start now" isn't activated within 15 min	Release (nothing was spent)
ACTIVE	ACTIVE (extended)	end_at passes with delivered below 90% of target	None; end_at += 24h, repeated until 90% is reached
ACTIVE	PAUSED	Experience edited (pending re-moderation), reported, disputed, or quality guard trips	None; window clock stops

From	To	Trigger	Token effect
PAUSED	ACTIVE	Re-moderation passes or review cleared	None; end_at extended by pause length
ACTIVE	COMPLETED	Delivered reaches target, or end_at passes with at least 90% delivered	None
ACTIVE / PAUSED	STOPPED	Sponsor stops it, or the author stops it on their own experience	None; no refund
ACTIVE / PAUSED	TERMINATED	Experience removed by moderation, deleted or made private; sponsor account put ON_HOLD	None; no refund
COMPLETED / STOPPED / TERMINATED	SETTLED	Close-out job (within 15 min): final stats, notifications, start the next queued Amplify	None

Every transition writes an `amplification_event` row and is guarded by the current state (compare-and-set), so a duplicate trigger is a no-op.

5. Token handling, settlement and refunds

Amplify reuses the Token spending service (reserve → commit → release). There are no refunds: once Tokens are spent they are final, and under-delivery is handled by extending the delivery window.

Purchase

1. Client calls eligibility, then purchase with an idempotency key.
2. Wallet service atomically reserves the tier price from spendable buckets in spend order: Creator grant Tokens, then earned Tokens oldest-expiry first. Starter allowance is not usable for Amplify.

3. A `token_redemption` row stores how much came from each bucket and lot (needed for refunds).
4. Amplify is created in RESERVED. A "start now" Amplify must activate within 15 minutes or it moves to FAILED_TO_START and Tokens are released.
5. On ACTIVE, reserved Tokens become SPENT (one ledger `spend` entry per bucket/lot).

Amplify spend never touches Lifetime Tokens / Status XP.

No refunds

- Spent Tokens are never returned: not for under-delivery, a sponsor or author stop, deletion, moderation removal, or an account hold.
- Reserved Tokens are released only if the Amplify never starts (cancelled before start, or failed to start). Nothing was spent, so this is not a refund.
- The wallet and ledger have no Amplify refund path. The only Amplify ledger entries are `spend` (at ACTIVE) and `release` (before ACTIVE).

Under-delivery: auto-extension

```
# runs whenever an ACTIVE Amplify reaches end_at
if delivered >= 0.90 * target:
    -> COMPLETED
else:
    end_at = end_at + 24h
    extension_count += 1
    # pacing held at the maximum (2.0) and daily cap doubled while extended
# delivery always stops at target, even mid-window
```

The check repeats at every new end_at until 90% is reached. There is no extension cap; ops is alerted if total extension exceeds the tier's original duration.

Example	Delivered at window end	What happens
Spotlight hits 2,000 on day 11	2,000 / 2,000	COMPLETED on day 11
Quick ends at 92%	230 / 250	COMPLETED
Momentum ends at 80%	600 / 750	Extended in 24h steps until 675 (90%), then COMPLETED
Sponsor stops Momentum early	300 / 750	STOPPED; no refund

Example	Delivered at window end	What happens
Experience removed by moderation	900 / 2,000	TERMINATED; no refund

Notifications

Sponsor: started · 50% delivered · extended (with reason) · completed (with stats) · paused · stopped · terminated (with reason).

Author (when the sponsor is someone else): "Your experience is being Amplified" at start, with a link to stop it; completion summary at the end.

6. Delivery: audience, feed insertion, ranking, pacing and inventory

Amplified cards compete for a small number of reserved feed slots. A slot is filled only when an Amplified card is relevant enough to the viewer; otherwise it stays organic. Feed quality wins over delivery.

Audience (who can be shown an Amplify)

A viewer is eligible for a given Amplify only if all hold:

- Viewer's current or home city = the restaurant outlet's city.
- Viewer is neither the author nor the sponsor, hasn't blocked or muted either, and hasn't hidden or reported this experience.
- Viewer has no qualified impression on this Amplify yet, and no organic impression of this experience in the last 7 days.
- Viewer isn't flagged (bot, farm, ON_HOLD).

Slot rules (feed composer)

Rule	Default
Slot positions	4th card, then every 8th (4, 12, 20, …)
Max Amplified cards per session	3
Max Amplified cards per viewer per day	6
Same author in one session	Max 1
Same restaurant in one session	Max 1 Amplified card

Rule	Default
Empty slot	Filled organically; never left blank

Ranking an Amplify for a slot

```
amp_score = relevance(viewer, experience)        # 0–1 from the existing feed
model
          × pacing_multiplier(amp)              # 0.5–2.0
          × quality_multiplier(amp)             # 0.7–1.3

# relevance floor: the candidate must beat the 40th-percentile relevance
# of this viewer's organic candidates, or the slot goes organic
```

Pacing multiplier keeps delivery even across the window:

```
expected   = target * (elapsed_active_time / window_length)
behind     = expected - delivered
pacing     = clamp(1 + behind / max(expected, 50), 0.5, 2.0)
exclude if delivered_today >= daily_cap or delivered >= target
```

While an Amplify is in an under-delivery extension (Section 5), its pacing multiplier is fixed at 2.0 and its daily cap is doubled, so the extension closes quickly.

Quality multiplier stays at 1.0 until 100 qualified impressions, then = clamp(engagement_rate ÷ organic_baseline_for_city, 0.7, 1.3), where engagement = helpful + save + profile tap + follow. Good content delivers faster; weak content slows but still gets a fair chance.

Slot fill algorithm

1. Composer reaches a slot position and session/day caps aren't hit.
2. Fetch eligible ACTIVE Amplifies for the viewer's city (cached list, refreshed every 60 s).
3. Drop any failing audience rules or session rules for this viewer.
4. Score the rest with amp_score; drop any below the relevance floor.
5. Serve the top one; log a render. If none remain, fill organically.

Inventory and admission control

Amplify sells only what the city's feed can deliver.

```
city_capacity(day) = forecast_sessions(day)           # same weekday,
trailing 14 days
                   × avg_amp_slots_reached_per_session
                   × 0.6                              # safety factor

booked(day) = Σ over ACTIVE + SCHEDULED amps in that city of
              remaining_target / remaining_days

admit new amp if, for every day in its window:
    booked(day) + new_target / duration <= city_capacity(day)
else: return NO_CAPACITY with earliest_start (first start date that fits,
within 7 days)
```

If no start within 7 days fits, the tier is shown as unavailable for that city.

7. Impression counting and quality guards

The client reports what was visible; the server decides what counts. Only server-validated, deduplicated impressions move the delivered counter.

Client

- Track viewability for every Amplified card using the platform visibility APIs (IntersectionObserver on web, on-screen frame tracking on mobile).
- When the card has been ≥ 50% visible for ≥ 1,000 ms continuously, send one `amp_view` event: `{amplification_id, render_id, viewer_id, session_id, device_id, visible_ms, max_visible_pct, client_ts}`.
- Send at most one `amp_view` per render. Batch events; retry offline events for up to 24 hours.
- Also send `amp_render` (served), `amp_hide`, `amp_report` and taps (profile, restaurant, experience open).

Server validation (per amp_view)

1. `render_id` exists, was served by the composer to this viewer, and belongs to this `amplification_id`.
2. Amplify was ACTIVE at the render's server timestamp (late-arriving events still count if the render was in-window).
3. Viewer passes audience rules at render time.
4. `visible_ms ≥ 1000` and `max_visible_pct ≥ 50`.

5. Rate limit: viewer has fewer than 30 Amplified qualified impressions in the past hour; otherwise flag the device.
6. Upsert into `amplification_impression` keyed on `(amplification_id, viewer_id)`. Insert succeeds = qualified; conflict = duplicate, ignored.
7. On insert, increment `delivered` and `delivered_today` atomically. If delivered reaches target, transition to COMPLETED.

Quality guards

Guard	Trigger	Action
Hide rate	Hides ÷ qualified impressions > 2%, after 200 qualified impressions	PAUSED, sent to moderation queue
Report rate	Any 3 reports from distinct viewers	PAUSED, sent to moderation queue
Engagement floor	Engagement rate < 30% of city organic baseline, after 200 qualified impressions	Quality multiplier pinned at 0.7; no pause

Pauses caused by guards are system pauses: the window is extended by the pause length. If moderation removes the experience, the Amplify is TERMINATED with reason REPORT_UPHELD (no refund).

Engagement from Amplified cards

Helpful reactions, saves and follows from Amplified cards are tagged `via_amplify = true`. They count for Tokens and Status XP under the normal engagement rules and caps, after the same fraud filtering. Impressions themselves earn nothing.

8. Data model, APIs, jobs and events

Four new tables, five public endpoints, two internal interfaces and six scheduled jobs. Token movement goes through the existing wallet and ledger; Amplify never writes balances directly.

Tables

amplification_tier (config) `tier_id, name, token_price, duration_hours, impression_target, daily_cap, active, valid_from, valid_until`

amplification `amplification_id, sponsor_type (diner | restaurant), sponsor_id, author_id, experience_id, restaurant_id, outlet_id, city_id, tier_id, membership_id, price_tokens, target, state, start_at, original_end_at, end_at, extension_count, activated_at, paused_total_ms, delivered, delivered_today, delivered_today_date, renders, hides, reports, engagements, quality_multiplier, redemption_id, end_reason, stopped_by (sponsor | author), closed_at, idempotency_key, created_at, updated_at` Indexes: `(city_id, state)`, `(sponsor_id, state)`, `(experience_id, state)`; partial unique index on `(experience_id)` where state in (ACTIVE, PAUSED), so only one Amplify per experience is live; queued ones sit in SCHEDULED ordered by created_at.

amplification_impression `amplification_id, viewer_id, render_id, session_id, device_id, visible_ms, max_visible_pct, render_at, counted_at` Primary key `(amplification_id, viewer_id)`. Partition by month.

amplification_event (append-only) `event_id, amplification_id, from_state, to_state, reason, actor (system / author / admin / moderation), payload_json, created_at`

Public API

Method	Endpoint	Purpose
GET	`/amplify/eligibility?experience_id=`	For the caller as sponsor: `eligible`, reason codes, and per tier: price, target, duration, `available`, `earliest_start`, queue position if the experience is already live
POST	`/amplify`	Any diner. Body: `experience_id, tier_id, start_at (optional), idempotency_key`. Reserves Tokens, creates the Amplify
POST	`/amplify/{id}/cancel`	Sponsor only, in RESERVED / SCHEDULED. Releases Tokens
POST	`/amplify/{id}/stop`	Sponsor, or the experience's author. ACTIVE / PAUSED → STOPPED. No refund
GET	`/amplify/{id}`	Sponsor and author: state, delivered / target, extensions, renders, engagement breakdown, daily series

Method	Endpoint	Purpose
GET	`/amplify?sponsor=me` · `/amplify?author=me`	Amplifies I paid for · Amplifies on my experiences
PATCH	`/me/settings` (`allow_others_amplify`)	Author's global switch for third-party Amplify
POST	`/experience/{id}/amplify-permission`	Author turns third-party Amplify on or off for one experience

All write endpoints are idempotent on the key and return the existing resource on replay.

Internal interfaces

- **Feed composer → Amplify service:** `get_amp_candidates(viewer_id, city_id, session_ctx) → [amplification_id, experience_id, pacing_multiplier, quality_multiplier]`. Composer applies relevance and the floor. Target p95 < 20 ms (served from the 60 s cache).
- **Events ingest → Amplify service:** `amp_view`, `amp_render`, `amp_hide`, `amp_report`, taps.

Scheduled jobs

Job	Frequency	Does
activate	1 min	SCHEDULED/RESERVED with start_at ⩽ now, moderation passed and no live Amplify on the experience → re-check eligibility → ACTIVE (commit) or FAILED_TO_START (release)
window check	1 min	ACTIVE with end_at ⩽ now → COMPLETED if ⩾ 90% delivered, else extend 24h
close-out	5 min	COMPLETED/STOPPED/TERMINATED with no closed_at → final stats and notifications → SETTLED; trigger activate for the next queued Amplify
pacing cache	60 s	Recompute pacing multipliers and rebuild per-city candidate lists
daily reset	00:00 IST	Reset delivered_today; recompute city capacity forecast

Job	Frequency	Does
reconcile	Nightly	delivered = count of impression rows; every ACTIVE-or-later diner Amplify has exactly one spend ledger entry set; alert on drift

Events emitted

`amplification_created`, `amplification_scheduled`, `amplification_activated`, `amplification_paused`, `amplification_resumed`, `amplification_completed`, `amplification_stopped`, `amplification_terminated`, `amplification_settled`, `amplification_milestone` (50%, 100%). Token events (`tokens_reserved`, `tokens_spent`, `tokens_released`, `tokens_reversed`) come from the wallet service as usual.

9. Edge cases and abuse controls

Most edge cases resolve to one of three outcomes: pause and extend the window, end with no refund, or release reserved Tokens because the Amplify never started.

Case	Behaviour
Author edits the experience while ACTIVE	Serve the last approved version; send edit to re-moderation; PAUSED until it passes (window extended). If it fails, TERMINATED with MODERATION_REMOVED; no refund
Author deletes or makes it private	TERMINATED; no refund. Queued Amplifies fail to start and are released
Experience removed by moderation	TERMINATED; no refund. Queued Amplifies released
Author stops a third-party Amplify	STOPPED; no refund to the sponsor; sponsor notified "stopped by the author"
Author turns off third-party Amplify while one is live	The live one continues unless the author stops it; queued third-party Amplifies fail to start and are released; new third-party purchases are refused

Case	Behaviour
Not Worth It posted and Amplified straight away	Purchase allowed while moderation is pending; Amplify waits in SCHEDULED and starts when moderation passes; if rejected, FAILED_TO_START and released
Several diners Amplify the same experience	One live at a time; up to 3 more queue and start in purchase order
Restaurant leaves Elite Partner mid-Amplify	Continue; Partner status doesn't affect Amplify
Restaurant outlet closes permanently	TERMINATED with OUTLET_CLOSED; no refund; queued Amplifies released
Sponsor account put ON_HOLD	TERMINATED with ACCOUNT_HOLD; no refund
Author account put ON_HOLD (sponsor is someone else)	PAUSED while the author's content is reviewed; resumes or terminates with the outcome
Viewer blocks the author or sponsor mid-flight	Viewer stops receiving it immediately
Wallet service down at purchase	Purchase fails cleanly; nothing reserved
Wallet service down at activation	Stay in RESERVED/SCHEDULED, retry each minute; FAILED_TO_START with full release after 15 minutes of failure
Close-out fails	Retry with backoff; alert after 1 hour
Impression events arrive after end_at	Count if the render was inside the window and the Amplify isn't SETTLED; close-out waits 15 min after end for late events
Tier price changes while an Amplify is running	No effect; price and target are copied onto the Amplify at purchase
City capacity drops after purchase	Covered by auto-extension

Abuse controls

Risk	Control
Fake accounts inflating impressions	Flagged viewers and rate-limited devices never count
Fake engagement on Amplified cards	Normal engagement fraud filters and monthly XP caps; `via_amplify` engagement is sampled for review
Restaurants or agencies buying reach through diner accounts	Tokens can't be bought; cluster detection on many Amplifies for one restaurant from linked accounts or devices
Amplifying someone else's experience to embarrass or pile on	Author can stop any Amplify on their experience and turn off third-party Amplify; report guard
Brigading a restaurant with negative reviews	1 Amplified card per restaurant per session; hide and report guards; cluster detection on many sponsors Amplifying *Not Worth It* experiences about one restaurant
Amplifying copied or low-quality content	Originality and moderation required before delivery; hide/report guards during delivery
Feed flooding	Slot caps, relevance floor and capacity admission

10. Config, analytics, acceptance criteria and open decisions

Config (admin-editable, logged)

Key	Default
`amp_tiers`	As Section 3
`amp_view_min_ms` / `amp_view_min_pct`	1,000 / 50
`amp_extend_below_ratio`	0.90
`amp_extension_step_hours`	24
`amp_extension_alert_ratio`	1.0 (× original duration)
`amp_max_experience_age_days`	90

Key	Default
`amp_sponsor_max_concurrent`	2
`amp_queue_max`	3
`amp_max_schedule_ahead_days`	7
`amp_slot_first` / `amp_slot_every`	4 / 8
`amp_max_per_session` / `amp_max_per_viewer_day`	3 / 6
`amp_relevance_floor_pct`	40
`amp_pacing_min` / `amp_pacing_max`	0.5 / 2.0
`amp_quality_min` / `amp_quality_max` / `amp_quality_warmup`	0.7 / 1.3 / 100
`amp_capacity_safety`	0.6
`amp_hide_rate_pause` / `amp_report_pause_count`	2% / 3
`allow_others_amplify` (author default)	true
`creator_grant_amp_cap`	none
`amp_enabled` (global and per city)	true

Analytics

Metric	Why it matters
Delivery rate: share of Amplifies reaching ≥ 90% of target	Are we keeping the promise
Extension rate and average extension length	How often we under-deliver, and by how much
Slot fill rate: Amplified slots filled ÷ slots offered	Demand vs supply per city
Hide and report rate, Amplified vs organic	Feed quality guardrail
Engagement per 1,000 impressions, Amplified vs organic	Is Amplified content good
Session length and feed scroll depth, holdout vs exposed	Is Amplify hurting the feed

Metric	Why it matters
Amplify buyers: repeat purchase, experiences written next 30 days	Is it driving creation
Tokens burned on Amplify ÷ total burn	Role in the Token economy

Keep a 5% viewer holdout that never sees Amplified cards, to measure feed impact.

Acceptance criteria

- [ ] Eligibility returns every failing reason code; an ineligible experience can't be purchased.
- [ ] Any diner can Amplify another diner's eligible experience; the author's off switch blocks it.
- [ ] A *Not Worth It* experience can be purchased for Amplify right after posting and starts when moderation passes.
- [ ] Purchase reserves the exact price; replaying the same idempotency key returns the same Amplify and reserves nothing more.
- [ ] Only one live Amplify per experience; further purchases queue (max 3) and start in order.
- [ ] A sponsor can't hold more than 2 ACTIVE, PAUSED or SCHEDULED Amplifies.
- [ ] Tokens are SPENT only on ACTIVE; cancel before start or a failed start releases 100%.
- [ ] No code path returns spent Tokens: stop, termination and under-delivery all leave the spend untouched.
- [ ] Below 90% at end_at extends the window by 24h, repeatedly; at 90% or more it completes; delivery always stops at target.
- [ ] Sponsor and author can both stop an active Amplify; result is STOPPED with no refund.
- [ ] A card visible ⩾ 50% for ⩾ 1 s counts once per viewer; the author, the sponsor, blocked viewers and flagged accounts never count.
- [ ] Daily cap is never exceeded (doubled during an extension).
- [ ] Amplified cards never exceed 3 per session or 6 per viewer per day, and never appear below the relevance floor.
- [ ] An edit pauses delivery until re-moderation; the window is extended by the pause.
- [ ] Hide-rate and report guards pause the Amplify as specified.
- [ ] Purchase is refused with an earliest_start when city capacity is full.
- [ ] Amplify never changes Lifetime Tokens / Status XP; engagement from it follows normal rules.

- [ ] Nightly reconciliation shows zero drift between impressions, delivered counts and ledger entries.
- [ ] Turning `amp_enabled` off stops all serving within 60 s without changing any state.

Open decisions (product)

- [ ] **D7:** Cap on how much of a Creator's monthly grant can go to Amplify.
- [ ] **Audience radius:** city-wide (current default) or nearer the outlet for smaller tiers.
- [ ] **Label copy:** "Amplified" vs "Amplified by [sponsor]". When someone Amplifies another diner's experience, should the sponsor be named?
- [ ] **Extension cap:** none (current) or a maximum, after which the Amplify closes regardless.
- [ ] **Author stopping a third-party Amplify:** allowed with no refund to the sponsor (current), or the author can only block future ones.

11. Restaurant Amplify memberships

Restaurants can buy a monthly membership that auto-Amplifies their latest positive diner experiences. They pay in rupees, not Tokens, and any outlet can buy, but auto-Amplify only runs while the outlet has a strong positive record. Delivery runs on the same engine as diner Amplify (Sections 6 and 7).

Tiers

Membership	Price per month (excl. GST)	Positive experiences auto-Amplified per cycle
Level 1	₹1,00,000	50
Level 2	₹1,75,000	150
Level 3	₹2,50,000	200+ (see D10)

Each auto-Amplified experience runs for `rest_amp_duration` = 7 days with a target of `rest_amp_target` = 500 qualified impressions (D9). At that default, Level 1 delivers about 25,000 qualified impressions a month.

Eligibility for auto-Amplify

Measured per outlet (D8) over the trailing 90 days, counting full, published, moderated experiences (verified and unverified).

Check	Rule
Positive experience score	Worth It ÷ (Worth It + Not Worth It) ⩾ 50%
Positive volume	Worth It experiences ⩾ 50
Standing	Restaurant not under review for review manipulation or fraud

Eligibility never blocks purchase: any outlet can buy or renew any tier. It's recomputed daily, and auto-Amplify runs only on days the outlet passes all three checks. On days it doesn't, the membership is SUSPENDED: it stays active and billed, no new auto-Amplifies start, and running ones finish. Missed days roll forward within the cycle; allowance still unused at cycle end is forfeited, with no refund. Before payment, the purchase flow shows the outlet's current score, Worth It count and exactly what it needs to qualify.

Which experiences get Amplified

An experience is eligible for restaurant auto-Amplify only if:

- it's about this outlet, sentiment Worth It, full, published, public, moderated and original;
- it was published in the last 90 days;
- it hasn't been restaurant-Amplified in the last 90 days;
- it has no live diner Amplify (skipped; can be picked once that ends);
- the author hasn't opted out (per experience or globally), and isn't ON_HOLD;
- it isn't reported, disputed or under review.

The restaurant can't choose, reorder, edit or exclude experiences. Selection is automatic, newest first.

```
# daily selection job, 06:00 IST, per ACTIVE membership
remaining_allowance = allowance - started_this_cycle
remaining_days      = days_until(cycle_end)
today_quota         = ceil(remaining_allowance / remaining_days)

candidates = eligible experiences for the outlet, newest first
start min(today_quota, len(candidates), capacity_left) auto-Amplifies
# a shortfall today rolls into tomorrow's quota within the same cycle
```

Unused allowance at cycle end is forfeited (D11) and shown on the dashboard.

Author consent and labelling

- The card label reads **Amplified by [Restaurant name]**, so viewers always know the restaurant is paying.
- The author is notified when their experience is picked.
- Authors can opt out per experience (ends that Amplify; the slot returns to the restaurant's allowance) and globally via the setting *Let restaurants Amplify my experiences* (default on, D12).
- Restaurant Amplify never changes the experience's text, sentiment or position on the restaurant page.
- Engagement on restaurant-Amplified cards counts for the author under normal Token and Status XP rules. Any extra reward for the author is D13.

Delivery rules (in addition to Sections 6–7)

Rule	Default
Share of Amplified slots that restaurant-sponsored cards can fill, per city per day	50% (`rest_amp_slot_share`)
Amplified cards from one restaurant per session	1 (existing rule)
Restaurant-sponsored cards from one restaurant per viewer per 7 days	3
Capacity	Memberships are admitted against city capacity like diner Amplifies; if full, purchase returns earliest_start
Quality guards	Same hide and report guards; a paused experience is replaced by the next candidate
Under-delivery	An experience ending below 90% of target is auto-extended in 24h steps until it reaches 90%, same as diner Amplify

Membership lifecycle and billing

State	Meaning
PENDING_PAYMENT	Purchased, invoice raised, not paid
ACTIVE	Paid; daily selection runs

State	Meaning
PAST_DUE	Renewal unpaid; 7-day grace, no new picks
SUSPENDED	Paid and billed, but the outlet doesn't currently meet eligibility; no new picks
CANCELLED	Won't renew; runs to cycle end
LAPSED	Grace ended unpaid, or cycle ended after cancel

- Cycle = one month from activation; auto-renews.
- Invoice = price + GST as applicable, through the existing restaurant billing (Bridge OS). Payment gateway details are out of scope here.
- Upgrade: immediate; charge the pro-rata price difference; allowance rises pro-rata for the remaining days.
- Downgrade: from the next cycle.
- Cancel: effective at cycle end; running Amplifies finish.
- No Tokens are involved, and no refunds for unused allowance.

Restaurant dashboard (Bridge OS)

Eligibility status (score, positive count, days below threshold), allowance used and remaining, and per Amplified experience: delivered / target, engagement, saves, profile and restaurant-page taps.

Data model additions

- **membership_tier:** `tier_id, name, price_inr, allowance, fair_use_cap, active`
- **restaurant_membership:** `membership_id, restaurant_id, outlet_id, tier_id, state, cycle_start, cycle_end, allowance, started_count, auto_renew, invoice_id, created_at, updated_at`
- **outlet_sentiment_daily:** `outlet_id, date, worth_it_90d, not_worth_it_90d, positive_score`
- **amplification:** add `sponsor_type (diner | restaurant), sponsor_id, membership_id`; `price_tokens` and `redemption_id` are null for restaurant Amplifies, and they have no Token step at close-out
- **Diner settings:** `allow_restaurant_amplify` (bool); per-experience `restaurant_amplify_opt_out`

API and jobs

Method / job	Purpose
GET `/restaurant/amplify/eligibility?outlet_id=`	Score, Worth It count, whether auto-Amplify would run today and what's missing, earliest_start
POST `/restaurant/membership`	Buy a tier; creates PENDING_PAYMENT and an invoice
POST `/restaurant/membership/{id}/upgrade` · `/downgrade` · `/cancel`	Change or cancel
GET `/restaurant/membership/{id}/report`	Dashboard data
PATCH `/me/settings` (`allow_restaurant_amplify`)	Diner global opt-out
POST `/experience/{id}/restaurant-amplify/opt-out`	Diner per-experience opt-out
Job: outlet sentiment	Daily, recompute 90-day score and counts; suspend or resume memberships
Job: selection	Daily 06:00 IST, start the day's auto-Amplifies
Job: renewal	Daily, renew, invoice, move to PAST_DUE or LAPSED

Acceptance criteria

- [ ] Any outlet can buy any tier; an outlet below 50% positive score, or with fewer than 50 Worth It experiences in 90 days, gets no auto-Amplifies until it qualifies.
- [ ] The purchase flow shows current eligibility and what's missing before payment.
- [ ] Only Worth It, full, moderated experiences from the last 90 days are picked, newest first; the restaurant can't influence selection.
- [ ] No experience is restaurant-Amplified twice within 90 days, or while it has a live diner Amplify.
- [ ] Daily quota spreads the allowance across the cycle; shortfalls roll forward within the cycle only.
- [ ] Cards show "Amplified by [Restaurant name]".
- [ ] Global and per-experience author opt-outs are honoured within one selection run; per-experience opt-out ends a running Amplify and returns the slot.

- [ ] Restaurant-sponsored cards never exceed 50% of a city's Amplified slots in a day, or 3 per restaurant per viewer per week.
- [ ] New picks stop on any day the outlet is below threshold and resume automatically the day it qualifies again.
- [ ] Restaurant Amplifies never touch Tokens or the diner ledger.

Open decisions (restaurant memberships)

- [ ] **D8:** Eligibility per outlet (default) or per restaurant brand across outlets.
- [ ] **D9:** Delivery per auto-Amplified experience: 7 days and 500 qualified impressions (default), or a different target per tier.
- [ ] **D10:** What Level 3's "200+" means: 200 guaranteed plus every further eligible positive experience up to a fair-use cap of 400 per cycle (default), or truly unlimited.
- [ ] **D11:** Unused allowance: forfeited at cycle end (default), or carried one cycle.
- [ ] **D12:** Author opt-in: on by default with opt-out (default), or off until the author opts in.
- [ ] **D13:** Should authors get a reward (e.g. Tokens) when a restaurant Amplifies their experience?
